The Mapping of Thematic Roles to Grammatical Functions in Mandarin BA Construction Denoting Causation: From the Perspective of Lexical Mapping Theory

Fengqi Li
College of Foreign Languages, Southwest University of Political Science and Law, Chongqing, 401120, China

Abstract—NP1 in the position of the subject of the mandarin BA construction denoting causation is usually occupied by patientlike roles and NP2 immediately following BA is usually occupied by agentlike roles. The causative relation between NP1 and NP2, with the former being the Cause, and the latter the Affectee, derives from the word BA, which triggers in the lexicon the morpholexical operation of causativization when it unites with the predicate. The operation involves either assignment of causative roles Cause and Affectee to the existent thematic roles or insertion of a new role Cause to the thematic structure, with the prominence of Cause or the thematic role assigned Cause always being over the other roles. Having undergone this morpholexical operation, the thematic structure correctly maps to and generates the grammatical functional structure according to the general principles and conditions stipulated by the Lexical Mapping Theory (LMT). The result of this research shows that even for a construction as unique as the mandarin BA construction denoting causation compared with any other languages, LMT is still well applicable in explaining its role-function mapping.

Index Terms—BA construction denoting causation, Lexical Mapping Theory, thematic role, grammatical function, morpholexical operation

I. INTRODUCTION

The traditional assumption that the mandarin BA construction semantically denotes disposal (Wang, 1980) has been constantly challenged. Jiang (1997), Shao and Zhao (2005) and Guo (2008), for example, argue that in addition to disposal, the BA construction can also denote causation. Moreover, Guo (2010) identifies a third denotation of the BA construction existing in modern (not contemporary) Chinese: suffering1. Sentences (1) through (3) below represent the three types of BA constructions respectively:

(1) 小高把那碗酒喝了。 (Disposal)
Xiao Gao ba nawanjiu he le.
Xiao Gao has disposed of that bowl of liquor by consuming it.

(2) 那碗酒把小高喝醉了。 (Causation)
Nawanjiu ba Xiao Gao he-zui le.
That bowl of liquor has caused Xiao Gao who consumed it to get drunken.

(3) 小高把个媳妇跑了。 (Suffering)
Xiao Gao ba ge xifu pao le.
[Unfortunately] Xiao Gao’s wife ran away.

The BA construction denoting disposal (hereinafter referred to as Disposal BA) represents how NP1, the subject of the construction which is usually the proto-agent, has disposed of NP2 immediately following BA which is usually the proto-patient (See Dowty, 1991, p. 572 for the discussion of proto-roles), through an action represented by a VP following BA+NP2.

The BA construction denoting causation (hereinafter referred to as Causation BA) describes how C (the Cause) has caused T (the Target) to have an R (a result) (Zou, 2001, p. 19), where C is in the position of NP1, the subject, which is sometimes the proto-patient [as in (2)] and sometimes assumes no thematic roles as in (4) below. T corresponds to NP2 which is usually the proto-agent, and the VP after BA+NP2 denotes both the action and its result.

1 Actually, the BA construction with the denotation of suffering is not only found in modern Chinese, but also in contemporary Chinese, as is shown by (3) below. So I would like to group the BA constructions in contemporary Chinese into three types: those denoting disposal, causation and suffering.
A distinctive feature of the Causation BA in contrast to the Disposal BA is that when the word BA and those preceding it are taken away\(^2\), the remaining part is still eligible, with the agent being the subject, and in such a case, BA may be viewed as a delexicalized verb which is semantically equal to SHI (使, meaning “to cause”) (Guo, 2008, p. 89). In Sentence (2), for example, after “nawanjiu ba” being taken away, the remaining part “Xiao Gao he-zui le” (Xiao Gao has got drunken) is still an eligible reading, whose subject is the agent. BA serves as the function of SHI, or to cause, i.e. it is that bowl of liquor that has caused Xiao Gao to get drunken.

The BA construction denoting suffering (hereinafter referred to as Suffering BA) means one suffering from damages, misfortune, dissatisfaction, etc., the structure of which can be represented as: (Subject the suffering entity) + BA + Object the theme + V + le the aspect (Guo, 2010, p. 50). In this type of construction, NP1 can be either vacant [as in (5)] or be the malficiary, i.e. the recipient of the misfortune [as in (3)], and NP2 is usually the proto-agent. When BA and the words preceding it are taken away, what remains is also an eligible reading, as in (3) where it reads as “Xifu pao le” (The wife has run away). However, NP1 is not the cause of the VP but the recipient of damages or misfortune caused by the VP. This is quite different from the Causation BA.

II. LEXICAL MAPPING THEORY

LMT, initially proposed by Bresnan and Kanerva (1989), is “about the syntactic realization of the arguments of a predicate” (Falk, 2001, p. 101). It is a subordinate theory of Lexical Functional Grammar (LFG) developed in the 1970s. LMT has later been modified by Bresnan (2001), Falk (2001) and Her (2003), among others. In this article, I will base my analysis on Falk (2001, pp. 101-114)’s model (together with my own fine tuning), which distinguishes three hierarchical structures through which the thematic roles assigned by the predicate are mapped to the grammatical functions (GFs):

- thematic structure, or θ-structure
- ↓
- argument structure, or a-structure
- ↓
- grammatical functional structure or f-structure

Figure 1. Mapping in LMT

The mapping between each structure is confined by certain principles and conditions, to which I will offer a brief introduction using the predicate place as an example (see also Li, 2011, 2012 and 2018).

(6) place

| θ-structure | [-o] | [-r] |
| Addition of values | [+o] | [+r] |...
| f-structure | SUBJ | OBJ | OBL...

Line 1 shows the θ-structure of place, in which the order of the roles is arranged according to their prominence in the thematic hierarchy, and the left-most role is called the θ (theta hat).

A. Thematic Hierarchy

ag(ent) > ben(efficacy) > exp(eriencer)/go(al) > ins(trument) > p(a)tient / th(eme) > loc(ative)

In Line 2 is the a-structure of place, where r stands for “thematically restricted”, indicating whether a certain GF is restricted by thematic roles, i.e. whether only specific roles, not all roles, correspond to that function, and o is the symbol for “objective”, denoting whether the GF is object or not. The values [+r] and [+o] reflect the features of the GFs in the syntactic level, and they per se are arguments which also reflect the prominence of thematic roles in the

---

\(^2\) Guo (2008, p. 89) argues that it is when the word BA (not BA together with the words preceding it) is taken away that the remaining part is eligible, but this may be true only for modern (not contemporary) Chinese, as is shown in such classics as Red Chamber Dream; it may not be true for contemporary Chinese, where only when both BA and the preceding words are taken away can one get eligible readings.
semantic level. Hence it can be said that a-structure is the locus linking both the θ-structure and the f-structure. B below shows how the GFs are decomposed into values of features, and C are the principles of mapping from the θ-structure to the a-structure.

B. Feature Decomposition of GFs

<table>
<thead>
<tr>
<th></th>
<th>[-θ]</th>
<th>[+θ]</th>
</tr>
</thead>
<tbody>
<tr>
<td>[-r]</td>
<td>SUBJ</td>
<td>OBJ</td>
</tr>
<tr>
<td>[+r]</td>
<td>OBL&lt;sup&gt;4&lt;/sup&gt;</td>
<td>OBJ&lt;sub&gt;0&lt;/sub&gt;</td>
</tr>
</tbody>
</table>

C. θ-structure to A-structure Mapping

a. Patients and themes map to [-r].

b. Secondary patients and themes map to [+θ] as a marked option.

c. Non-theme/patient roles map to [-θ].

According to C-c, both the ag and loc of place is mapped to [-θ], and according to C-a, the th is mapped to [-r] – this is how the a-structure in Line 2 is generated.

Line 3 shows the process of mapping for the a-structure to the f-structure, which is constrained by three principles and two conditions:

D. A-structure to F-structure Mapping

a. SUBJ mapping 1: A [-θ] which is Θ maps to SUBJ.

b. SUBJ mapping 2: [-r] may map to SUBJ.

c. NonSUBJ mapping: Add positive values of features where possible.

E. Well-formedness of A-structure to F-structure Mapping

a. Function-argument biuniqueness (FAB): Each a-structure role corresponds to a unique f-structure function, and each f-structure function corresponds to a unique a-structure role.

b. The subject condition: Every predicater must have a subject.

Based on D-a, the first argument of place [-θ], which corresponds to the Θ – agent in the θ-structure, is directly mapped to the SUBJ in the f-structure. The second argument [-r] can also be mapped to SUBJ according to D-b, but this would violate E-a because, if so, SUBJ would correspond to two arguments. At this time, D-c stands out and adds the positive value [+θ] to [-r] (it is [+θ], not [+r], that is added because the latter would contradict the existing value [-r]). Similarly, the positive value [+r] is added to the third argument [-θ]. Finally, both the second and third arguments are respectively mapped to OBJ and OBL<sub>loc</sub> according to B.

The afore-mentioned principles and conditions are supposed to be universal across languages, but they may not be applicable directly to individual languages for the sake of parametric variation. Certain morpholexical operations, including deletion, insertion or change of roles (or sometimes of arguments<sup>3</sup>), are needed to modify the θ-structure (or the a-structure) within the lexicon before the universal principles and conditions are applicable.

III. θ-structures of Causation BA

The VP in the Causation BA is usually a verb compound: it can be a resultative verb compound (RVC), like he-zui in (2) and lei-dao in (4), or a V-DE construction, “a complex stative construction” (Li, 2015, p. 2), like jide tuantuanzhuan and chide zhi xiang tu in (7) and (8).

(7) 小高把他妈急得团团转。
Xiao Gao ba tama jide tuantuanzhuan.
Xiao Gao BA his mum worry-DE pace around
Xiao Gao worried his mum so much that she paced around (like a cat on hot bricks).

(8) 这碗饭把小高吃得直想吐。
Zhewanfan ba Xiao Gao jide zhi xiang- tu.
This bowl of rice BA Xiao Gao eat-DE almost want vomit
This bowl of rice that Xiao Gao was eating almost caused him to vomit.

The Head of the compound (which is the first verb) in the Causation BA can be a one-valency verb like lei and jide, or a two-valency verb like chide and he. Most of the compounds can not be followed by a retained object, but they can if they are composed of the Head and cheng le (become ASP):

(9) 那条阴沟把这好好的孩子摔成了个残废。（Zou, 2001, p.18）
Natiao yingou ba zhe haohao de haizi shuai-cheng le ge caifei.
That ditch BA this able-bodied child tumble-become ASP a cripple

<sup>3</sup> OBL = oblique case, as “on his head” in “He placed a rabbit on his head”. It is a grammatical function whose role (usually thematic role) is explicitly marked, either by a preposition (as in English) or a semantic Case. The subscript “θ” indicates it is restricted to certain thematic roles. In the case of place, only the role of loc can fill the position, so this grammatical function is represented as OBL<sub>loc</sub>. OBJ<sub>0</sub> refers to the secondary object in some languages which is characteristically restricted to a single thematic role or a small set of thematic roles.

<sup>4</sup> Traditional LMT did not mention operation of arguments, nor change of roles, but in some mandarin expressions like BA constructions and resultative verb compounds, morpholexical operations in these aspects are quite necessary to ensure correct mapping from the θ-structure to the f-structure.
That ditch into which the child was tumbled has turned him from an able-bodied person to a cripple.

(10) 那副药把小高吃成了个傻子。
    Nafuyao        ba   Xiao Gao  chi-cheng  le  ge  shazi.
    That medicine BA Xiao Gao eat-become ASP a fool
    That medicine Xiao Gao took has caused him to become a fool.

Differences in the valency of the verbs and the presentation (or lack) of retained objects naturally lead to different θ-structures:

(2a) he-zui <ag            th               <exp>>
     Xiao Gao nawanjiu  Xiao Gao

(4a) lei-dao <exp             <th>>
     Xiao Gao  Xiao Gao

(7a) ji-de-tuantuanzhuan <exp               <th>>
     tama           tama

(8a) chi-de-zhi-xiang-tu <ag               pt               <exp>>
     Xiao Gao  zhewanfan  Xiao Gao

(9a) shuai-cheng <ag               <th₁          th₂>>
     haizi  haizi  canfei

(10a) chi-cheng <ag               pt               <th₁          th₂>>
      Xiao Gao nafuyao  Xiao Gao  shazi

The illustrations, where the broken line means one entity bearing two roles simultaneously, the outer pointed brackets represent the θ-structure of the Head and the inner ones indicate the θ-structure of the other verb following the Head, provide us with a complicated picture of the θ-structures of the Causation BA.

What is noticeable is that one entity may bear two thematic roles in this type of constructions, like “Xiao Gao” in (2a) who bears the role of agent assigned by he and simultaneously the role of experiencer assigned by zui. These two roles constitute one “composite role”, represented as ag-exp (see Her, 2004 and Li, 2011 for more discussion about composite roles).

It is also noticeable that some VPs like lei-dao, ji-de-tuantuanzhuan and shuai-cheng may assign an additional role when appearing in the BA construction, a situation which can not possibly occur in a more “normal” reading where the proto-agent is at its usual position of the subject:

(4b) 小高累倒了。
    Xiao Gao  lei-dao  le.
    Xiao Gao tire-collapse ASP
    Xiao Gao has got so tired that he collapsed.

(7b) 他妈急得团团转。
    Tama  ji-de-        tuantuanzhuan.
    His mum worry-DE- pace around
    His mum was worried so much that she paced around (like a cat on hot bricks).

(9b) 孩子摔成了个残废。
    Haizi  shuai-cheng  le  ge  caifei.
    Child tumble-become ASP a cripple
    The child was tumbled into a cripple.

In these “normal” readings, only one or two roles are assigned (the composite role is counted as one role), but in their corresponding BA constructions (4), (7) and (9), an additional role is introduced, borne respectively by zehuoer, Xiao Gao and natiao yingou.

How are such complicated θ-structures of the Causation BA mapped to the f-structures? This is the question to be addressed in the following sections. Since the θ-structures of both RVC and V-DE constructions are similar to each other and the paths of mapping from the θ-structures to the f-structures are also similar, I will only focus on the former in the following discussion.

IV. F-STRUCTURE OF CAUSATION BA

LFG divides GFs into two types (Dalrymple, 2001):
Governable: SUBJect, OBJect, OBJectθ, COMPlement, XCOMPlement, OBLiqueθ
Non-governable: ADJunct, XADJunct

Studies in LMT frequently focuses on the four major governable functions: SUBJ, OBJ, OBJθ and OBLθ. There is no exception for this study. What is out of question is that NP1 in the Causation BA corresponds to SUBJ, but what remains a problem is the GF NP2 corresponds to. This actually is determined by the syntactic properties and semantic functions of the very word BA. It has been labeled as a verb, co-verb, light verb or preposition respectively by different researchers (Zhang & Bai, 2013, p. 139). But at present a consensus seems to have been arrived at in the field of generative grammar, which views BA as a light verb. Huang, Li and Li (2009), for example, claims in The Syntax of Chinese that “BA is an explicit light verb which does not assign thematic roles and has a VP as its complement; the NP following BA is the external OBJ of the VP, which is semantically related to its internal OBJ” (As cited in Hu, 2011, p. 208).

As for the semantic functions of BA, an obvious one is to express the meaning of causation. What is equally important is the function of introducing and marking a role of the VP (since it does not assign any roles) represented by NP2. In this sense, NP2 can be said to correspond to the OBL, a GF that is “associated with particular semantic roles and marked to indicate their function overtly” (Dalrymple, 2001, p. 26). In the BA construction, only specific roles can appear in the position of NP2, and what is more, they are overtly marked by BA. This conforms to the semantic function of an OBL.

Nevertheless, it is not without controversy concerning the category label of BA. As has been pointed out by Kit (1998, p. 499), since Zhang (1956), researchers of Chinese linguistics have tended to see BA as a simple preposition. Yang (2014, p. 418) also implicitly took BA as a preposition in the discussion of the thematic roles of the BA construction. Wen and Cheng (2007, p. 112), on the other hand, explicitly exclude BA from the category of light verbs. However, the controversy about BA’s syntactic properties does not alter its semantic function as a marker of specific roles of the VP. Hence, the fact of NP2 corresponding to OBL does not change with the change of the category label of BA.

In addition to NP1 and NP2, NP3 also exists in some cases when the VP has its own retained object. In such cases, of course, NP3 corresponds to OBJ.

Take again (2), (4) and (10). Their f-structures are represented as:

(2b) he-zui <SUBJ OBL-ag-exp
nawanjiu Xiao Gao

(4c) lei-dao <SUBJ OBL-exp-th
zhehuoer Xiao Gao

(9c) shuai-cheng <SUBJ OBL-ag-th OBJ>
Nattiao yingou haizi canfei

(10b) chi-cheng <SUBJ OBL-ag-th OBJ>
Nafuyao Xiao Gao shazi

It can be seen that diversified as the θ-structures of the Causation BA are, its f-structures are quite similar (SUBJ, OBL, with or without OBJ). Then how does mapping from the former to the latter occur? Can LMT correctly predict the mapping since the Causation BA is an alien construction compared with the majority of other patterns both in Chinese and other languages including English on which LMT was developed? These questions will be answered in the next section.

V. MAPPING OF θ-STRUCTURE TO F-STRUCTURE

For the Causation BA, the first problem concerning mapping is that of the composite roles, which means two roles are simultaneously mapped to one GF, which would violate FAB (E-a). In (2a), for instance, the two constituent roles ag and exp of the composite role ag-exp are mapped respectively to [-o] and [-o], which in turn are simultaneously mapped to one single GF; namely, OBL [as is shown in (2c)]. To tackle this problem, Her (2004) and Li (2011) propose a morpholexical operation rule of “role suppression”, which means through the operation undergoing in the lexicon, the role assigned by the Head of the VP figures prominently and suppresses the other role, with only the former being mapped to the a-structure and further to the f-structure (Li, 2011). Under this rule, the mapping of (2c) is modified [as is shown in (2d) where θ indicates role suppression].
Causativization assigns two causative roles, namely Cause and Affectee, to the existing roles, bringing about the variation exists with the mapping of this particular construction. We can assume that, when BA unites with the VP in the lexicon, some morpholexical operation has to function to modify the θ-structure or a-structure before the LMT principles and conditions can function well to ensure the correct mapping. In other words, it is the introduction of BA that triggers the operation that “rectifies” the unconventional linguistic parameter and brings it back to the “right path.”

Then what is the morpholexical operation BA triggers? A comparison of the reading without BA and the one with BA [ (2) ] may reveal that the former is an objective report of the fact, while the latter puts stress on causation: It is exactly that bowl of liquor that has caused Xiao Gao to get drunken. This is why we call this type of construction. This means that parametric variation exists with the mapping of this particular construction. We can assume that, when BA unites with the VP in the lexicon, some morpholexical operation has to function to modify the θ-structure or a-structure before the LMT principles and conditions can function well to ensure the correct mapping. In other words, it is the introduction of BA that triggers the operation that “rectifies” the unconventional linguistic parameter and brings it back to the “right path.”

F. Causativization of the Causation BA

When BA denoting causation unites with a verb compound, the Cause (C) is assigned to the proto-patient of the Head and Affectee (A) to its proto-agent; the role assigned C has prominence over any other roles in the θ-structure.

In this rule, it is the roles of the Head, not those of the other verb, that are assigned causative roles. This is because the latter have been suppressed in the morpholexical operation of role suppression which functions prior to causativization. The assignment of causative roles stipulated in the rule is based on the observation that the proto-agent of the Head (borne by NP2) is always acted upon by the Cause, while the proto-patient (borne by NP1) is always the Cause that acts upon the proto-agent.

Now apply this rule to the mapping of (2) and we will see the right outcome:

| Role suppression | <ag> th <exp> |
| Role suppression | <ag> th <exp> |
| Causativization | <th-C ag-A <exp> |
| A-structure | [-r] [-o] |
| Addition of values | [+r] |

Footnote: Causativization is proposed by Li (1995) in the discussion of the mapping between thematic roles and syntactic arguments of mandarin RVC within the framework of GB. The core concepts are: thematic roles and causative roles are simultaneously assigned to the arguments when causative relation exists between the constituent elements of the verb compound; similar to thematic roles, there is also hierarchical relation between causative roles, with Cause being more prominent than Affectee; causative hierarchy has priority over thematic hierarchy whenever there is a conflict. In this article I borrow the concept of causativization to discuss the role-function mapping of the Causation BA within the framework of LMT.
F-structure

\[
\begin{array}{c|c|c|c}
\text{SUBJ} & \text{OBL} & \text{OBL}_{ag-exp} \\
\text{nawanjiu} & \text{Xiao Gao} & \text{Xiao Gao} \\
\end{array}
\]

First, \(exp\) is suppressed due to the rule of role suppression; then, Rule F is activated to assign A and C respectively to \(ag\) and \(th\), and this inverts their hierarchical relation, with \(th\) being more prominent than \(ag\) and becoming the \(\hat{o}\). Till now, the \(\theta\)-structure has been modified in the lexicon, and what follows is the functioning of the LMT principles and conditions which will regulate the follow-up mapping: One, \(th\) is mapped to \([-r]\) according to C-a, and \(ag\) to \([-o]\) according to C-c; two, \([-r]\) may be mapped to SUBJ according to D-b and this is strengthened because of its correspondence to the \(\hat{o}\); three, \([-o]\) is added a positive value \([+r]\) according to D-c and is mapped to OBJ according to B. The result we get is exactly the \(f\)-structure as is shown in (2b), which manifests that Rule F is legitimate in modifying the \(\theta\)-structure of the VP so that it can be mapped to the \(f\)-structure along the right path under the guidance of the LMT principles and conditions.

To test the applicability of Rule F, I will examine a more complicated case [see (10)]: the Causation BA with the VP having a retained object where the Head is still of two valencies.

\[
\begin{array}{c|c|c|c|c|c|c|c|c|c|c|c}
\text{F-structure} & \text{SUBJ} & \text{OBL} & \text{OBL}_{ag-th} & \text{OBJ} \\
\text{nawanjiu} & \text{Xiao Gao} & \text{Xiao Gao} & \text{shazi} \\
\end{array}
\]

Similar to the mapping in (2f), \(pt\) and \(ag\) are correctly mapped to SUBJ and \(OBL_o\) when BA triggers the morpholexical operation of causativization. \(th_2\), which corresponds to NP3 the retained object, not influenced by causativization since it is not the role assigned by the Head, is also correctly mapped to OBJ according to the LMT principles and conditions. It shows that, complicated as the \(\theta\)-structure of the Causation BA is, Rule F together with the LMT principles and conditions can guarantee correct role-function mapping.

**B. Mapping When the Head Is of One Valency**

Different from the verb compounds with a two-valency Head, those with a one-valency Head will usually assign new thematic roles as long as they are integrated into the Causation BA (see Section III). This is also assumably attributed to the semantic function of BA, which triggers a kind of morpholexical operation that adds a new thematic role for the compound in the lexicon when it unites with the latter. Take (4) as an example. The VP lei-dao only assigns one composite role \(exp-th\) (4a) before BA joins it, but an additional role borne by \(zhe \ huoer\) appears after BA joins it. This role can not be \(ag\) for it does not initiate the action of \(lei\) tire, nor can it be \(exp\) for it is not \(zhe \ huoer\) but Xiao Gao who felt tired. It can not be any other agent-like roles, either. As a matter of fact, instead of being a thematic role, it is purely a causative role, namely the Cause, that brings about the consequence of \(Xiao \ Gao \ lei\) (Xiao Gao got tired). Here what BA triggers is not the assignment of causative roles to the existent thematic roles but the insertion of \(C\) to the original \(\theta\)-structure. Likewise, we can assume that \(C\) has the prominence over any other roles, i.e. it being the \(\hat{o}\). We also assume that it is mapped to \([-o]\) since the NP representing \(C\) generally will not be the OBJ. Then we get another lexical rule:

G. Cause insertion of the Causation BA:

When BA denoting causation unites with a verb compound, the Cause is inserted to the latter’s \(\theta\)-structure, and is kept prominent over the other roles and mapped to \([-o]\).

According to this rule, the mapping of (4) can be represented as:

\[
\begin{array}{c|c|c|c|c|c|c|c|c|c|c|c|c|c}
\text{F-structure} & \text{SUBJ} & \text{OBL} & \text{OBL}_{exp} & \text{OBJ} \\
\text{zhe \ huoer} & \text{Xiao Gao} & \text{Xiao Gao} & \text{shazi} \\
\end{array}
\]

C, after being inserted, becomes the \(\hat{o}\) and is mapped to \([-o]\) and further to SUBJ according to D-a. \(Exp\) is mapped to \(OBL_o\) according to C-c and D-c. So the mapping is successfully accomplished.

Rule G is also applicable to the Causation BA with a retained OBJ. Take (9) as an example:

\[
\begin{array}{c|c|c|c|c|c|c|c|c|c|c|c|c|c}
\text{F-structure} & \text{SUBJ} & \text{OBL} & \text{OBL}_{ag} \\
\text{chao \ cheng} & \text{Xiao Gao} & \text{Xiao Gao} & \text{shazi} \\
\end{array}
\]

© 2019 ACADEMY PUBLICATION
As a matter of fact, Rule G, like Rule F, is a kind of causativization by nature since it changes a reading without causative meaning (haizi shuai-cheng le ge canfei The child was tumbled into a cripple) into one with causative meaning [(10)] by inserting the causative role Cause (represented by natiao yingou). Besides, in the lexicon, BA is the identical word with the one in the previously discussed case, i.e. the Causation BA with a verb compound whose Head is a two-valency verb, which means that it is redundant or even contradictory to govern causativization triggered by the same BA with two different rules. Therefore, it is quite necessary to integrate F and G into one single rule to govern the two kinds of causativization which are seemingly different but in essence are the same. Just two steps are needed to accomplish the integration: First, naming the two rules with one term: causativization, and second, clarifying when to insert and when to assign the causative roles. Then the integrated rule can be represented as:

H. Causativization of the Causation BA:

When BA denoting causation unites with a verb compound, it either inserts C (the Cause) to the latter’s θ-structure and maps it to [-o] (when the Head is a one-valency verb), or assign C to the proto-patient of the Head and A (the Affectee) to its proto-agent (when the head is a two-valency verb); C or the role assigned C has prominence over any other roles in the θ-structure.

This rule covers both cases of the Causation BA which have different θ-structures and gets BA to automatically determine whether to insert or assign causative roles based on the valency of the Head so that redundancy and randomness are avoided.

VI. CONCLUSION

The VPs that can enter the Causation BA are usually verb compounds like RVCs and V-DE constructions, the Head of which can be of one valency or two valencies. When the very word BA denoting causation unites with the VPs in the lexicon, it will trigger the morpholexical operation of causativization which either inserts the causative role Cause to the θ-structure of the Head when it is of one valency or assigns the two causative roles Cause and Affectee to its existent thematic roles when it is of two valencies. The inserted Cause will be mapped to [-o]; the Cause or the role assigned Cause possesses prominence higher than any other roles in the θ-structure. The θ-structures of the Causation BA, having undergone this morpholexical operation, are mapped successfully to the f-structures following the path stipulated by the LMT principles and conditions.

The result of this research provides adequate evidence for the explanatory power of LMT whose principles and conditions that are hypothesized to be universal across languages can ensure the correct mapping of θ-structures to f-structures of the Causation BA after morpholexical operation that is of language-specific parametric variation, no matter how diversified and complicated the construction’s θ-structures are and how alien its f-structure may seem to be, compared with other languages like English.

As has been mentioned, there are three types of BA constructions in contemporary Chinese. Even though they are gathered under the same umbrella of “BA constructions”, the word BA in each type has different semantic functions, which means that the morpholexical operation BA triggers may be different and accordingly the θ-structure to f-structure mapping may also be different. It is not likely that one lexical rule be applied to govern the morpholexical operations of all types of BA constructions. It may be legitimate to see BA in each type as a different word stored in the lexicon which functions differently in its domain. Therefore, the three types of BA constructions need to be investigated separately in order to explore the different ways of realization of the θ-structure in the surface f-structure. I have discussed the Disposal BA elsewhere (Li, 2018) and the Causation BA in this article; further research is needed to explore the Suffering BA.
